## Abstracts

The global Fire Sound and Light Alarm market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

A fire alarm is a device that emits sound and light signals to alert people of a fire. It is usually used in buildings, factories, public places and other places where fire alarms are required. Fire audible and visual alarms usually consist of a sound generator and a light source. Sound generators can emit high-volume alarm sounds, usually continuous or intermittent, to attract people's attention. The light source is usually a flash or LED light, which can emit a strong flash signal to attract people's attention. Fire audible and visual alarms are usually connected to a fire alarm system or fire detector. When the fire alarm system or fire detector detects a fire, the audible and visual alarm will be triggered to emit sound and light signals to alert people of the existence of the fire. This can help people detect fires early and take appropriate escape and fire-fighting measures to ensure personnel safety. Fire audible and visual alarms have the characteristics of high volume, bright light signals and continuous or intermittent alarm sounds, which can arouse people's alert when a fire occurs and prompt them to take appropriate actions. It is an important component of the fire alarm system and plays an important role in timely fire alarm and personnel evacuation.
