According to our (Global Info Research) latest study, the global Fixed Frequency RF Driver market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

The fixed-frequency RF drive is an AC motor drive that uses RF power to generate the electrical energy required by the motor, and controls the motor's speed and torque by controlling the frequency and voltage of the power supply. Unlike variable frequency drives, the output frequency of fixed frequency RF drives is fixed, usually 50Hz or 60Hz, so it is also called a fixed frequency drive. Fixed frequency RF drives are typically used for loads that require high torque to start and run, such as pumps, fans, and compressors. Their control circuits are relatively simple and cost-effective, and for some loads they may perform better than variable frequency drives. However, they typically do not provide variable speed control and therefore may not be suitable in applications where precise control of motor speed is required.
