Abstracts

According to our (Global Info Research) latest study, the global Fixed Offshore Wind Solution market size was valued at US\$ 335 million in 2024 and is forecast to a readjusted size of USD 457 million by 2031 with a CAGR of 4.1% during review period.

Fixed Offshore Wind refers to wind power generation equipment that is fixedly installed in the ocean through a foundation structure (such as pile foundations or gravity foundations), and is usually suitable for areas with shallow water depths. This technology can effectively capture stronger and more stable wind forces, and therefore is often superior to onshore wind power in terms of power generation efficiency and capacity utilization. With the growing global demand for renewable energy, fixed offshore wind power is becoming more and more widely used, especially in countries such as the United Kingdom, Germany and Denmark, where the technology is relatively mature. Although offshore wind power has a relatively small impact on the environment, the potential impact on the marine ecosystem still needs to be carefully considered during construction and operation. In short, fixed offshore wind power not only provides an important solution for sustainable energy development, but also makes a positive contribution to addressing climate change and reducing greenhouse gas emissions. Oceaneering International's advanced technologies and services meet the needs of challenging offshore applications, including comprehensive geophysical, geotechnical and seismic surveys to collect precise data to inform decision making for fixed offshore wind projects.
