Abstracts

The global Fixed Point DSP market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

A fixed-point digital signal processor is a dedicated digital signal processor used to perform various digital signal processing algorithms and tasks such as filtering, convolution, Fourier transform, etc. Unlike general-purpose microprocessors, fixed-point DSPs use fixed-point arithmetic, that is, numerical calculations using integers rather than floating-point numbers. This computing method can increase the computing speed and efficiency of the processor without sacrificing accuracy, while also reducing power consumption and hardware cost. Therefore, fixed-point DSP is widely used in low-power, high-efficiency and low-cost digital signal processing applications.

This report studies the global Fixed Point DSP production, demand, key manufacturers, and key regions.
