## Abstracts

According to our (Global Info Research) latest study, the global Fixed Spot Non-Contact Thermometer market size was valued at US\$ 193 million in 2025 and is forecast to a readjusted size of US\$ 284 million by 2032 with a CAGR of 5.5% during review period.

In 2025, global Fixed Spot Non-Contact Thermometer production reached approximately 250 K units, with an average global market price of around 750 US\$/unit.

A fixed spot non-contact thermometer is a specialized temperature-measuring instrument designed to be installed at a fixed location to detect the surface temperature of objects or human bodies without direct physical contact, operating on the basic principle of blackbody radiation and infrared thermal radiation detection. Unlike portable non-contact thermometers, it features a stable installation structure, continuous monitoring capability, and high measurement accuracy, typically ranging from  $\pm 0.3^\circ\text{C}$  to  $\pm 0.5^\circ\text{C}$ , and is widely configured with functions such as real-time data transmission, over-temperature alarm, and data storage to meet the needs of long-term, automated temperature monitoring in specific scenarios. It is mainly used to measure the surface temperature of moving objects, small targets, or objects with small heat capacity and rapid temperature changes, and can also be applied to temperature distribution detection of temperature fields, avoiding the interference of contact measurement on the measured object and ensuring the safety and accuracy of the measurement process.

The average single-line production capacity of Fixed Spot Non-Contact Thermometer is 13 K unit, the average gross profit margin was 47.4%.

The industry chain of fixed spot non-contact thermometers has clear upstream, midstream and downstream links. The upstream mainly includes suppliers of core components (infrared sensors, signal processing chips, etc.) and supporting materials (metal casings, high-temperature resistant plastics, etc.), whose product quality directly affects the final product's accuracy and stability. The midstream involves R&D, assembly, calibration and testing of the thermometers, integrating upstream components and optimizing performance for different scenarios, with some customized development according to customer needs. The downstream covers industrial production, public health, building detection and other fields, and the demand of these industries drives the upgrading of the entire industrial chain.

The cost structure of fixed spot non-contact thermometers has distinct component weights, mainly affected by product configuration and production scale. Core components account for 45%-55% of the total cost, with infrared sensors (25%-30%) and signal processing chips (10%-15%) as the key drivers due to their core technology and high price. Structural and auxiliary materials account for 15%-20%, production and assembly for 10%-15%, R&D and after-sales service for 10%-15%, and transportation and marketing for about 5%.

The demand for fixed spot non-contact thermometers is steadily growing, with broad business opportunities. Industrial automation promotes demand in high-temperature, high-risk scenarios; public places maintain stable demand for temperature screening, with prominent upgrading needs for more accurate and intelligent products; expanding application fields further boost market demand. Business opportunities lie in strengthening core technology R&D to reduce import dependence, conducting customized development for different downstream fields, and seizing policy dividends to expand market share in emerging areas.
