An electrical substation is a part of a power generation, transmission, and distribution system that converts voltage from high voltage to low voltage or vice versa, and also performs other important transmission and distribution functions. The main function of the substation is to use the transformer to change the voltage, and secondly, it can also perform power factor compensation and power system protection for the power grid. Generally speaking, substations are part of power companies, and in a few cases, they are large factories or merchants. In the early years, substations usually required manual on-site control or fault repair, but now they mainly rely on data acquisition and monitoring systems for remote control.
