Flaking mill is a mechanical device that applies extrusion force to the material through two or more rollers rotating in opposite directions, causing it to undergo plastic deformation and be processed into flakes. This equipment is usually composed of a frame, rollers, a transmission system, a lubrication system, etc. During operation, the rollers are driven by a motor to rotate, and the material entering the gap between the rollers is squeezed to obtain the desired flake product.

Flaking mill is an important mechanical device, mainly used to process oily materials, process them into flakes through extrusion force, and initially squeeze out crude oil.
