Flame retardant fabric coating is a functional chemical material specially applied to the surface of various textiles. By forming a flame retardant coating on the surface of the fabric, it significantly improves its flame resistance and self-extinguishing properties when exposed to fire, effectively inhibits the spread of flames, and reduces the release of smoke and toxic gases. The coating is usually composed of flame retardants, film-forming resins, additives and solvents. It can be applied to natural fibers (such as cotton and linen), synthetic fibers (such as polyester and nylon) or their blended fabrics through processes such as dipping, spraying or scraping. It is widely used in home decoration, transportation, public places, industrial protection and other fields to meet the flame retardant safety needs of textiles in different environments.
