Abstracts

For a long time, oil producers have simply flared associated petroleum gas (so called 'flare gas'), considered an unwanted oil by-product. But with increased energy demand coinciding with an escalation in environmental consciousness — flaring now often is avoided, and sometimes even prohibited. Flare-to-Hydrogen technology converts environmentally harmful flaring gases right at the flare of an oil production field to clean hydrogen and solid carbon. As flare gas compositions vary in a wide range, the process filters out pure methane CH₄, which reacts in the methane pyrolysis process to hydrogen and solid carbon.

According to our (Global Info Research) latest study, the global Flare-to-Hydrogen market size was valued at US\$ million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of %during review period.
