Abstracts

The global Flat Transformer market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Planar transformers are small components with high surface-to-volume ratios and very short thermal paths. It is good for heat dissipation. The turn-to-turn losses between the primary and secondary windings are small. The unique geometry of this magnetic core can effectively reduce the core loss. So it can achieve high magnetic flux density. It can work between -40?~130?. Good coupling between windings can keep the leakage inductance between winding turns to a minimum. The wiring from the output to the auxiliary components is short and tightly fitted, so that the leakage inductance on the wiring between the windings is minimal. Excellent high-frequency characteristics Prior to this, when the transformer was operated at high frequency, the switching loss would increase and the transformer would overheat.

This report studies the global Flat Transformer production, demand, key manufacturers, and key regions.
