Abstracts

The global Flexible Polymer Vapor Chamber Radiator market size is expected to reach \$ 1190.8 million by 2030, rising at a market growth of 5.6% CAGR during the forecast period (2024-2030).

Flexible polymer vapor chamber radiator allows for structural applications such as internal enclosures, such as smartphone mid-frames, external housings or enclosures. This effectively combines thermal and structural properties into one, reducing the number of components in the assembly. The higher material yield strength also results in a thinner and lighter vapour chamber structure compared to copper, in addition to combining multiple components. The thinner walls maximise the internal steam space, which in turn increases the effective thermal conductivity of the steam chamber, regardless of the thermal properties of the metal. Switching to a stainless steel steam chamber can help you reduce the thickness of your thermal management solution or maximise the power transferred from the heat source.
