According to our (Global Info Research) latest study, the global Flight Propulsion Systems market size was valued at USD 173010 million in 2023 and is forecast to a readjusted size of USD 268990 million by 2030 with a CAGR of 6.5% during review period.

A flight propulsion system generally consists of an aircraft engine and some means to generate thrust, such as a propeller or a propulsive nozzle. An flight propulsion system must achieve two things. First, the thrust from the propulsion system must balance the drag of the airplane when the airplane is cruising. And second, the thrust from the propulsion system must exceed the drag of the airplane for the airplane to accelerate. In fact, the greater the difference between the thrust and the drag, called the excess thrust, the faster the airplane will accelerate.
