According to our (Global Info Research) latest study, the global Float-type Gas Density Meter market size was valued at US\$ 23.1 million in 2024 and is forecast to a readjusted size of USD 30 million by 2031 with a CAGR of 3.8% during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

The float-type gas density meter calculates the density of the gas by immersing a float in the gas and using the equilibrium relationship between the buoyancy and gravity of the float in the gas. This instrument usually works based on the Archimedean principle, that is, the buoyancy of a floating body (float) immersed in a fluid is equal to the gravity of the fluid displaced by the float. Since the buoyancy is proportional to the density of the gas, the density of the gas can be calculated by measuring the buoyancy of the float in the gas (or equivalently, by measuring the displacement or immersion depth of the float). The float-type gas density meter is mainly used to measure the density of various gases, such as air, nitrogen, oxygen, etc. It has a wide range of applications in industrial production, environmental monitoring, scientific research and other fields.
