Floating Offshore Wind Anchors are key components in floating offshore wind power systems, used to fix and connect floating foundation platforms to the seabed to ensure that they remain stable in complex marine environments such as wind, waves, and currents. They are connected to the floating platform through a mooring system (composed of anchor chains, steel cables, synthetic fiber cables, etc.) to limit platform drift while bearing the dynamic loads generated by platform movement. Its core function is to provide reliable anchoring force to ensure the safe operation of floating wind turbines in deep sea environments, and it is one of the core technologies for realizing the expansion of offshore wind power to deep seas.
