According to our (Global Info Research) latest study, the global Floating Point DSP market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

A floating-point digital signal processor is a processor designed to perform digital signal processing algorithms and tasks. Unlike fixed-point DSP, floating-point DSP uses floating-point arithmetic for numerical calculations, which can achieve higher calculation accuracy and dynamic range, but also requires more processor resources and power consumption. Floating-point DSP is usually used in applications that require high calculation accuracy, such as high-precision signal processing, machine learning, and deep learning. Due to the use of floating-point operations, floating-point DSP has a slower operation speed than fixed-point DSP, and its power consumption and cost are also higher than fixed-point DSP, but it can handle more complex algorithms and tasks.

This report is a detailed and comprehensive analysis for global Floating Point DSP market.
