Abstracts

The global Floating Point DSP market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

A floating-point digital signal processor is a processor designed to perform digital signal processing algorithms and tasks. Unlike fixed-point DSP, floating-point DSP uses floating-point arithmetic for numerical calculations, which can achieve higher calculation accuracy and dynamic range, but also requires more processor resources and power consumption. Floating-point DSP is usually used in applications that require high calculation accuracy, such as high-precision signal processing, machine learning, and deep learning. Due to the use of floating-point operations, floating-point DSP has a slower operation speed than fixed-point DSP, and its power consumption and cost are also higher than fixed-point DSP, but it can handle more complex algorithms and tasks.

This report studies the global Floating Point DSP production, demand, key manufacturers, and key regions.

This report is a detailed and comprehensive analysis of the world market for Floating Point DSP, and provides market size (US\$ million) and Year-over-Year (YoY) Growth, considering 2022 as the base year.
