A floating ship-mounted excavator is an excavation device installed on a ship hull, mainly used for underwater earthwork operations, such as port construction, river dredging, submarine pipeline laying and other projects. The equipment is supported by the buoyancy of the hull and has the ability to move and operate on the water surface. Floating ship-mounted excavators are usually equipped with long arms and multi-functional excavation devices, which can perform excavation, loading and transportation operations at different depths underwater. They are suitable for complex water environments and are widely used in marine engineering and water conservancy engineering construction.
