Floating Turbidity Barrier is a temporary structure used in water bodies to control the spread of sediment, silt, and other pollutants during construction or dredging activities. Made of durable, impermeable fabric, it is anchored in place and floats on the water's surface while extending below to a specified depth. The barrier helps to contain and isolate disturbed sediments, preventing them from spreading and impacting surrounding aquatic environments. It is commonly used in marine, river, and lake construction projects to protect water quality and minimize environmental damage.
