The flooded heat exchanger is a highly efficient heat exchange device widely used in refrigeration and air conditioning systems. Its working principle is to allow the refrigerant to completely submerge the heat transfer surface of the evaporator or condenser to ensure the maximum contact area and the best heat transfer efficiency. In the flooded evaporator, the low-temperature and low-pressure liquid refrigerant fills the entire evaporation space, exchanges heat with the chilled water flowing through the heat exchange tube, and evaporates into gas after absorbing heat; while in the flooded condenser, the high-temperature and high-pressure gaseous refrigerant is cooled and condensed into liquid.
