Abstracts

According to our (Global Info Research) latest study, the global Floor Drainage Systems market size was valued at US\$ 2236 million in 2025 and is forecast to a readjusted size of US\$ 3147 million by 2032 with a CAGR of 5.0% during review period.

Floor Drainage Systems are also called gullies or point drains. They are used for carrying away water from industrial surfaces to sewage system or they are an outlet of standard or slot channels.

In 2025, global Floor Drainage Systems sales volume reached approximately 86.9 million units, with an average price of approximately US\$ 25 per unit.

Bathroom renovation, wet-room design, and barrier-free shower adoption are driving demand in residential and hospitality markets. Floor drainage systems are increasingly used not only as basic plumbing components but also as part of modern bathroom design, especially in walk-in showers, wet rooms, curbless showers, and accessible bathrooms. The 2025 Houzz Bathroom Trends Study reported that 39% of renovating homeowners enlarged their showers, while wet rooms accounted for 16% of renovated bathrooms and were chosen for better space use, aesthetics, and accessibility. This supports demand for linear drains, wall drains, tile-in drains, stainless steel channels, and higher-design-value shower drainage products.

Commercial hygiene and water-management requirements support steady demand in foodservice, healthcare, hospitality, and public facilities. Floor drainage systems are essential in commercial kitchens, hospitals, laboratories, laundries, locker rooms, swimming pools, food processing plants, and public restrooms because these

environments require frequent washdown, wastewater removal, odor control, and easy cleaning. Floor drains are designed to remove standing water, and floor sinks are commonly used in commercial kitchens and some hospital applications as indirect waste receptors. This creates recurring demand for stainless steel drains, trench drains, anti-odor drains, easy-clean grates, sediment baskets, grease-management interfaces, and high-flow systems.

Urban flooding, heavier rainfall, and climate-resilience investment are increasing demand for drainage infrastructure. Beyond indoor bathrooms and commercial floors, floor and trench drainage systems are used in garages, parking areas, industrial yards, transit facilities, warehouses, loading bays, and urban hardscape projects. Surface-water flooding risk is rising in many urban areas due to heavier rainfall, aging infrastructure, and rapid urbanization; recent reporting on England found that urban areas contain a large majority of homes at high flood risk, mainly from surface-water flooding. Cities are also updating stormwater drainage master plans to address waterlogging, urban flooding, and infrastructure stress under climate-change conditions. These trends support demand for trench drains, slot drains, heavy-duty grates, stormwater channels, and integrated floor/surface drainage systems.
