According to our (Global Info Research) latest study, the global Flotation Reagent For Mineral Processing market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

Flotation reagents are chemicals used to selectively separate minerals during the froth flotation process, which is a widely used method for mineral processing. Flotation reagents work by making some minerals hydrophobic, or water-repelling, while others remain hydrophilic, or water-attracting. This selective separation is achieved by adding reagents to the mineral slurry, which then adheres to air bubbles in the mixture and floats to the surface.
