The global Flotation Reagent For Mineral Processing market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Flotation reagents are chemicals used to selectively separate minerals during the froth flotation process, which is a widely used method for mineral processing. Flotation reagents work by making some minerals hydrophobic, or water-repelling, while others remain hydrophilic, or water-attracting. This selective separation is achieved by adding reagents to the mineral slurry, which then adheres to air bubbles in the mixture and floats to the surface.
