According to our (Global Info Research) latest study, the global Flow Cytometry Multifactor Detection Kit market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

Flow cytometry multi-factor kits are mainly used for flow cytometry to simultaneously quantitatively analyze multiple soluble proteins in samples to monitor changes in immune function. The principle is to use microspheres with different fluorescence to coat different capture antibodies. , go to different target proteins in the affinity sample, and then combine with the fluorescently labeled detection antibody to form a double-antibody sandwich microsphere, which is consistent with the ELISA sandwich method. However, compared with traditional ELISA kits, flow multifactor detection kits acquire more experimental data at a time, with high experimental efficiency and less sample consumption.
