Flow Cytometry Service is a professional analytical service based on flow cytometry, which is used to quickly and quantitatively detect and analyze the physical and chemical properties of single cells or particles suspended in liquid. Through the flow cytometer, cells or particles in the sample pass through the laser beam in sequence, and the instrument determines the size, shape, complexity and surface or internal molecular expression of the target based on its scattered light signal and fluorescence characteristics. This service is widely used in immunology, oncology, molecular biology and other fields, and is a key tool for studying cell function, classification and quantity.
