## Abstracts

According to our latest research, the global Flue Gas Desulfurization Process market size will reach USD 7376 million in 2031, growing at a CAGR of 5.5% over the analysis period.

Flue gas desulfurization is a key environmental technology used to remove sulfur dioxide (SO<sub>2</sub>) produced during industrial combustion to reduce acid rain and other air pollution. The most widely used FGD methods include wet, dry and semi-dry desulfurization. Wet desulfurization is the most common type. It removes SO<sub>2</sub> efficiently by introducing flue gas containing SO<sub>2</sub> into an absorption tower and reacting with limestone or lime water solution to produce calcium sulfite or gypsum precipitation. The desulfurization efficiency can reach more than 95%.
