## Abstracts

The global Fluidized Bed Furnace market size is expected to reach \$ million by 2030, rising at a market growth of % CAGR during the forecast period (2024-2030).

Fluidized Bed Furnace is a type of combustion system that utilizes the principle of fluidization to efficiently burn solid fuels or perform various thermal processes. It consists of a bed of solid particles (usually a granular material) that is suspended and fluidized by an upward flow of gas or air. This fluidization enables excellent heat transfer and thorough mixing of fuel and combustion gases, resulting in efficient combustion and reduced pollutant emissions. Fluidized bed furnaces are commonly used in applications such as power generation, waste incineration, and chemical processes, providing high combustion efficiency and flexibility in fuel selection.
