Abstracts

Fluorescence microscopy is an optical microscope that uses fluorescence and phosphorescence instead of, or in addition to, reflection and absorption to study properties of organic or inorganic substances. Fluorescence microscopy has become an essential tool in biology as well as in materials science as it has attributes that are not readily available in other optical microscopy techniques

Scope of the Report:

This report focuses on the Fluorescence Microscopy in global market, especially in North America, Europe and Asia-Pacific, South America, Middle East and Africa. This report categorizes the market based on manufacturers, regions, type and application.

Fluorescence microscopy has become an essential tool in biology as well as in materials science as it has attributes that are not readily available in other optical microscopy techniques. The use of an array of fluorochromes has made it possible to identify cells and submicroscopic cellular components and entities with a high degree of specificity amid nonfluorescing material. The fluorescence microscope can reveal the presence of a single fluorescing molecule.

The worldwide market for Fluorescence Microscopy is expected to grow at a CAGR of roughly 0.8% over the next five years, will reach 530 million US\$ in 2023, from 500 million US\$ in 2017, according to a new GIR (Global Info Research) study.
