According to our (Global Info Research) latest study, the global Fluorescent X-ray Coating Thickness Gauge market size was valued at US\$ 55.7 million in 2024 and is forecast to a readjusted size of USD 100 million by 2031 with a CAGR of 6.5% during review period.

The working principle of the X-ray fluorescence coating thickness gauge is based on the X-ray fluorescence effect. The instrument will emit a beam of high-energy X-rays to the surface of the object to be measured. These X-rays interact with the atoms in the sample, causing the atoms to absorb the energy of the X-rays and be excited, releasing secondary X-rays (fluorescence radiation). Each chemical element releases X-rays of a specific energy, so by measuring the characteristic energy and intensity of these released secondary X-rays, the X-ray analyzer can perform qualitative and quantitative analysis of the coating thickness and composition of the material being measured.
