Abstracts

The global Fluorine-Based Grease for Chemical Industry market size is expected to reach \$ 110 million by 2032, rising at a market growth of 5.2% CAGR during the forecast period (2026-2032).

Global sales of fluorine-based greases for the chemical industry reached 256 tons in 2025, with an average price of US\$294/kg.

Fluorine-based greases for the chemical industry are a class of highly chemically resistant lubricants specifically designed for the extreme corrosive environments of the chemical industry. They are made from perfluoropolyether (PFPE), chlorofluorocarbon oils, or partially fluorinated polyethers as base oils, combined with polytetrafluoroethylene (PTFE), fluorinated graphite, or calcium sulfonate thickeners. These greases possess extremely strong chemical inertness (resistance to strong acids, strong alkalis, strong oxidants, and organic solvents), wide temperature range adaptability (-30? to 300?), non-flammability, and material compatibility. They provide long-term maintenance-free lubrication in chemical production plants, solving the problems of rapid failure, dissolution, or safety accidents caused by traditional greases in corrosive media.

The raw material system of fluorinated greases uses perfluoroolefins as the core monomers, mainly including hexafluoropropylene (HFP) and tetrafluoroethylene (TFE), which are converted into perfluoropolyether base oils through photo-oxidation or anionic polymerization. The thickener uses high-purity polytetrafluoroethylene (PTFE) micropowder (typically
