Abstracts

The global Fluoropyridines market size is expected to reach \$ 149 million by 2032, rising at a market growth of 6.4% CAGR during the forecast period (2026-2032). Fluoropyridines are a family of fluorinated heteroaromatic compounds in which one or more hydrogen atoms on the pyridine ring are replaced by fluorine. They include monofluoropyridines such as 2-fluoropyridine (a heterocyclic aromatic compound C_5H_4FN widely used as a key intermediate), as well as multi-fluorinated derivatives and perfluoropyridine in which all ring positions are substituted by fluorine. As fluorinated heterocycles, fluoropyridines are valued in pharmaceuticals, agrochemicals and advanced materials because C-F substitution significantly modifies lipophilicity, metabolic stability and binding interactions.

Upstream, fluoropyridines are mainly produced from pyridine or substituted pyridines via selective fluorination or fluorinated building blocks. Downstream, fluoropyridines are widely used as building blocks and intermediates in pharmaceuticals, agrochemicals and advanced materials. 2-Fluoropyridine is highlighted as a versatile heterocyclic intermediate for synthesizing active pharmaceutical ingredients (APIs), anti-inflammatory and anti-cancer agents, as well as herbicides and fungicides.

Perfluoropyridine-based scaffolds are employed in high-performance polymers, coatings and functional materials because of their high chemical and thermal stability.

In 2025, global sales of fluoropyridines reached approximately 10,675 tons, with an average global market price of around US\$ 8,633/ton. Production capacity varies significantly among manufacturers, with gross profit margins ranging from approximately 25% to 50%.
