## Abstracts

Vulcanization is to produce a certain degree of cross-linking of fluororubber, so that it has good performance. Among various fluororubbers, the most commonly used are fluoroolefin polymers and copolymers of fluoroolefins and fluorine-containing vinyl ethers. The commonly used vulcanizing agent is diamine or organic peroxide. Under the action of amine, the molecular chain of fluororubber is dehydrofluorinated to form a double bond, and then the double bond reacts with the diamine to form a cross-linking bond.
