Fly cutters, also known as single-point face millers, are specialized cutting tools used for finishing flat surfaces to achieve very smooth and flat surfaces, primarily on lathes, milling machines, or CNC machines. A fly cutter typically consists of a single cutting edge mounted at the end of a toolholder, which performs the cutting action through rotational motion. Fly cutters are typically mounted on the toolpost of a lathe or milling machine and perform cutting by rotating either the workpiece or the tool. Operators need to adjust cutting parameters according to the desired surface quality and the material being machined, such as cutting speed, feed rate, and depth of cut. For optimal results, careful tool setting is necessary to ensure the precise relative positioning of the tool and the workpiece.
