## Abstracts

According to our (Global Info Research) latest study, the global Flyback Transformer market size was valued at USD 1106.1 million in 2023 and is forecast to a readjusted size of USD 1645.5 million by 2030 with a CAGR of 5.8% during review period.

Flyback Transformer (Flyback Transformer) is a transformer in a conversion circuit, which is mainly used to convert DC voltage into another DC voltage. The working principle of the flyback transformer in the circuit is to change the output voltage by changing the magnetic flux. It has the advantages of simple circuit structure and low cost, so it is widely used in many power supply applications.

In a flyback converter, the output receives energy when the primary winding is powered off, and is in a discharged state when the primary winding is powered on. The difficulty in designing a flyback converter lies in how to design the magnetic core and coil of the transformer to meet the performance requirements under different input voltage and load conditions. Especially when the input voltage fluctuates in a wide range, the magnetic core of the transformer may work between continuous current mode and discontinuous current mode, which makes the design more complicated.

The Global Info Research report includes an overview of the development of the Flyback Transformer industry chain, the market status of Electronics (RF Transformers, IF Transformers), Precision Equipment (RF Transformers, IF Transformers), and key enterprises in developed and developing market, and analysed the cutting-edge technology, patent, hot applications and market trends of Flyback Transformer.
