Abstracts

The global Foam Compressor market size is expected to reach \$ million by 2030, rising at a market growth of % CAGR during the forecast period (2024-2030).

A foam compressor is a mechanical device used to compress foam materials. It compresses foam materials to reduce their volume for easier storage, transportation and recycling. Foam compressors usually use the principle of spiral rotation to generate pressure. The foam material is sent into the compression chamber through the feed port. After multi-stage compression in the compression chamber, the compressed foam material is pushed out of the discharge port. There are many types of foam compressors, including cold pressing type, hot pressing type, hot melt type and hydraulic pushing type. Foam compressors are used in many fields, such as packaging, transportation, construction, home appliances, etc.

This report studies the global Foam Compressor production, demand, key manufacturers, and key regions.
