The Foam Filled Containment Boom is a device for emergency response and cleanup of oil contamination. It is a floating cofferdam that is commonly used to contain and collect oil and other pollutants floating on the surface of a body of water. Foam-filled cofferdams are usually made of polyurethane or other similar material and filled with buoyant foam. These weirs create a barrier in the water body, preventing oil contamination from spreading over a wider area.

Foam Filled Containment Boom plays an important role in oil pollution emergency response and cleanup efforts. They are widely used in ports, ship transportation, oil extraction and storage, etc. to reduce and control the impact of oil pollution on the water environment and ecosystem. At the same time, the use of Foam Filled Containment Boom also needs to follow relevant environmental protection regulations and operating guidelines to ensure safe and efficient oil pollution cleaning.
