Foamed calcium silicate is a special calcium silicate material with good foaming performance and chemical stability. Foamed calcium silicate is mainly composed of elements such as calcium (Ca), silicon (Si), and oxygen (O). Its chemical formula is usually a variant of CaSiO_3 , containing different proportions of CaO and SiO_2 . The microstructure of foamed calcium silicate includes needle-like crystals, microporous structures, etc. These structural characteristics contribute to the realization of its foaming performance. When foamed calcium silicate is heated, it decomposes and releases gases such as carbon dioxide. These gases form a stable bubble film inside the material to prevent gas leakage and bubble collapse, thereby ensuring the smooth progress of the foaming process.
