Abstracts

Focal segmental glomerulosclerosis (FSGS) is a type of rare kidney disease that affects the kidney's filtering system (glomeruli) resulting in proteinuria and serious scarring. Focal segmental glomerulosclerosis (FSGS) is usually fatal since it causes kidney failure within four to nine years followed by dialysis and then death. FSGS advances much more swiftly than diabetic nephropathy. Massive proteinuria, nephrotic syndrome, edema, hyperlipidemia, and hypoalbuminemia are some of the common symptoms of the disease. Risk factors include obesity, infection, sickle cell disease and reflux nephropathy.

According to our (Global Info Research) latest study, the global Focal Segmental Glomerulosclerosis (FSGS) Treatment market size was valued at USD 322.1 million in 2022 and is forecast to a readjusted size of USD 427.1 million by 2029 with a CAGR of 4.1% during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

The market for FSGS treatment is primarily driven by the increasing disease burden, rising focus towards rare diseases, and increased R&D activity. Geographical analysis shows that North America is expected to maintain its dominance in this market, particularly due to well-structured healthcare facilities, early adoption of therapies and diagnosis options, and better reimbursement policies, as compared to Others regions.
