Foliar control fungicide is a chemical or biological agent that is sprayed on the surface of crop leaves to prevent and treat plant diseases caused by fungi. Compared with soil treatment or seed treatment, foliar application can more directly and quickly form a protective layer at the initial site of the disease, inhibiting the invasion or reproduction of pathogens. This type of fungicide usually has protective, therapeutic or eradication functions, and can be divided into two categories: contact type (forming a barrier on the leaf surface) and systemic type (absorbed and conducted by plant tissues). It is often used to control rust, powdery mildew, downy mildew and other highly prevalent diseases.
