## Abstracts

Foliar feeding is a technique of feeding plants by applying liquid fertilizer directly to their leaves. Plants are able to absorb essential elements through their leaves. The absorption takes place through their stomata and also through their epidermis. Transport is usually faster through the stomata, but total absorption may be as great through the epidermis. Plants are also able to absorb nutrients through their bark.

According to our (Global Info Research) latest study, the global Foliar Feeding market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

The European region is the largest consumer of foliar feeding across the globe. However, the foliar feeding market in the Asia Pacific region is projected to grow at the highest CAGR during the forecast period. Limited availability of agricultural land and high demand for food are expected to drive the demand for efficient fertilizers in this region. foliar feeding fertilizers have significant advantages that include easy application, uniform distribution of nutrients to crops, and limited labor costs. All these advantages make foliar feeding fertilizers a suitable product for horticultural crops, field crops, and turfs & ornamentals.
