Abstracts

The global Folic Acid and Folate market size is expected to reach \$ 128 million by 2032, rising at a market growth of 5.2% CAGR during the forecast period (2026-2032).

Folic acid and folate are different forms of vitamin B9 that support healthy cell growth and development, especially in pregnancy. Folate is the natural form of vitamin B9 that occurs in various foods, such as leafy vegetables, beans, nuts, and eggs. Folic acid is the synthetic form of vitamin B9 that is used in supplements and added to fortified foods, such as bread, pasta, rice, and cereals. Folate is converted into the active form of vitamin B9 called 5-methyltetrahydrofolate (5-MTHF) in the digestive system before entering the bloodstream. Folic acid needs to be converted into 5-MTHF in the liver or other tissues, which is a slow and inefficient process in some people.

The industry trend of folic acid and folate is expected to be positive in the coming years, as the demand for these products increases in various sectors due to their benefits for preventing birth defects, anemia, cardiovascular diseases, cancer, cognitive function, depression, and more. Some of the factors driving the market growth are the rising consumption of folic acid and folate supplements among pregnant women and other populations, the increasing awareness regarding micronutrients, the growing popularity of fortified foods and beverages, and the development of new products and technologies by leading manufacturers.

From the perspective of product market application, medicines and health products are the largest application scope, accounting for about 84.3% of the global total sales. The food additive industry is the second largest application, mainly added in bread, milk powder and other fields. This type of application accounts for about 15.1% of the global total sales. Other uses are generally scattered small applications, such as cosmetics,

research and development and other fields. The total sales of this part is usually not high, accounting for 0.7%.
