Abstracts

The global Food Anti Caking Agents market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Anti-caking agents are additives used in powdered or granulated materials such as table salt or confectioneries to prevent lump formation (caking) and to improve packaging, transport, flowability, and consumption. Caking mechanisms vary depending on the material. Crystalline solids frequently cake due to the formation of a liquid bridge and the subsequent fusion of microcrystals. Glass transitions and changes in viscosity can cause amorphous materials to cake. Polymorphic phase transitions can also cause caking. Some anti-caking agents absorb excess moisture or coating particles with a water-repellent coating. Calcium silicate (CaSiO3), a common anti-caking agent, absorbs water and oil when added to products such as table salt.

This report studies the global Food Anti Caking Agents production, demand, key manufacturers, and key regions.
