According to our (Global Info Research) latest study, the global Food Contaminant Testing market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

Food contaminant testing is to detect toxic or potentially harmful substances existing in food, such as pathogens, pesticides, gmo, toxins, etc.

The pathogens segment includes pathogens such as E. coli, salmonella, campylobacter, and listeria. The diverse weather conditions in different regions may cause a pathogenic attack. This is compelling vendors to come up with products and solutions to detect the presence of food-borne pathogens. For instance, a bacterial protein isolated from the intestine of chicken can be used as a food preservative and to prevent the growth of food poisoning causing agents.
