Abstracts

Food and beverage enzymes are highly selective chemical catalysts that initiate metabolic reaction within unripe fruit and other food materials.

Scope of the Report:

In the 1930s, Edward Howell, MD, the food enzyme pioneer, found that there is a difference between plant enzymes and those that are produced by the body. He was convinced that plant enzymes in food and supplements have a different function in human digestion than that of the body's own digestive enzymes. With this theory, he began isolating and concentrating plant enzymes from their sources. He found the difference is that food enzymes begin digesting food in the stomach and will work for at least one hour before the body's digestive system begins to work. For this reason, enzymes should be considered essential nutrients. Unfortunately, this is not the case, and food manufacturers are removing them from food to gain shelf-life.

Historically enzymes are considered to be non-toxic and not of safety concern for consumers since they are naturally present in ingredients used to make food.

However, food enzymes produced industrially by extraction from plant and animal tissues, or by fermentation of microorganisms, are assessed for safety.

The worldwide market for Food Enzyme is expected to grow at a CAGR of roughly xx% over the next five years, will reach xx million US\$ in 2023, from xx million US\$ in 2017, according to a new GIR (Global Info Research) study.
