Abstracts

According to our (Global Info Research) latest study, the global Food Grade Stachyose market size was valued at US\$ 136 million in 2025 and is forecast to a readjusted size of US\$ 187 million by 2032 with a CAGR of 4.7% during review period.

Stachyose is a natural oligosaccharide found in legumes and some vegetables. It acts as a prebiotic, promoting the growth of beneficial bacteria in the gut and maintaining digestive health. As a source of dietary fiber, stachyose helps maintain a balanced gut microbiome and is often used in food products to improve texture and sweetness.

Food-grade stachyose is a functional oligosaccharide extracted from natural plants (such as Chinese artichoke and *Rehmannia glutinosa*). The core upstream raw material is Chinese artichoke (*Stachys affinis*), and it is also found in legumes such as soybeans and peas.

Global sales in 2025 are projected to be approximately 11,000 tons, with an average market price of around US\$12,000 per ton. The industry's gross profit margin is in the range of 15%?30%.

As a natural prebiotic with proven efficacy, its applications are rapidly expanding from traditional health supplements to various everyday food and beverages, indicating vast market potential. The core driving force behind this industry's development primarily stems from the demand side. With increasing public health awareness, particularly regarding gut health and the pursuit of 'clean label' products, stachyose is finding widespread application in areas such as lactic acid beverages, infant formula, and health foods.

Despite its immense potential, the industry still faces multidimensional bottlenecks. The singularity and vulnerability of raw material supply remain a core pain point; therefore, reducing the production cost of stachyose and increasing its yield has become a key research focus in this field.
