Abstracts

In food production plants, risks for contamination are at their highest levels. Raw ingredients and finished products pre-packaging are both located here and exposed to the environment of the facility. An air purifier to remove harmful particles from the air is most critical in these plants. Many food production plants rely on simple HVAC systems with HEPA filters. These systems are highly effective for removing airborne contaminants from the environment, with an effectiveness of over 99% for 0.3-micron particles. This is a highly efficient system, and it is great for removing particles that include dust, viruses, bacteria, fungi, and virtually any other type of airborne particle.
