According to our (Global Info Research) latest study, the global Forced Circulation Evaporative Crystallizer market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

Forced circulation is a form of technology that uses an external forced circulation pump to return materials to the equipment for recirculation. Evaporation crystallization boils and vaporizes the solution containing non-volatile substances through heat transfer to increase the saturation of the solution until the solute is precipitated in the form of solid crystals after supersaturation. The basic principle of the forced circulation evaporation crystallizer is to add a forced circulation pump to the original process to allow the material to evaporate repeatedly until the crystals are over-precipitated.
