## Abstracts

The global Forensic Video Enhancement market size is expected to reach \$ 3500 million by 2032, rising at a market growth of 5.2% CAGR during the forecast period (2026-2032).

Forensic Video Enhancement is a professional judicial technical solution targeting low-quality video evidence with defects like blurriness, low illumination, heavy noise, motion blur and compression distortion; it adopts specialized algorithms to optimize video clarity, suppress noise, enhance contrast, restore faded details and sharpen key features including human faces, license plates, scene textures and traces, while strictly abiding by the minimum intervention principle to maintain the authenticity and integrity of original video data, ensuring the legal validity of processed videos, and providing identifiable visual evidence for case investigation, judicial authentication and trial judgment to assist law enforcement and judicial personnel in confirming facts and cracking cases.

The Forensic Video Enhancement industry is trending toward AI-driven intelligent iteration (integrating deep learning and latent diffusion models to realize adaptive enhancement for complex scenarios, automatic key feature extraction and real-time processing), cloud-edge collaborative deployment (combining cloud-based large-scale computing with edge-side on-site rapid processing), standardized judicial compliance (unifying enhancement process traceability and result authentication standards) and anti-deepfake integration (adding tamper identification functions while enhancing videos); opportunities lie in the massive growth of low-quality video evidence generated by popular surveillance and law enforcement devices, the rising demand for restoring blurred evidence in complex criminal and traffic cases, the promotion of judicial digitization accelerating the application of professional enhancement tools, and the urgent need for enhancement technology to identify AI-tampered videos, while core challenges include ensuring the legal validity of enhanced videos (proving no original

data tampering in judicial authentication), overcoming technical difficulties in enhancing extreme scenario videos such as strong backlight, high-speed motion blur and low-resolution infrared footage, balancing high enhancement effect with original data fidelity to avoid generating misleading pseudo details, reducing the technical threshold and deployment cost for grassroots law enforcement and judicial institutions, and keeping up with the iteration of advanced AI video tampering technologies to ensure the effectiveness of enhancement solutions.
