According to our (Global Info Research) latest study, the global Forging Technology Simulation Software market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

Forging technology simulation software is a computer program that is used to simulate and analyze the forging process. It allows manufacturers to virtually design and test the forging process before actually producing the parts. The software uses mathematical models and algorithms to simulate the behavior of the material during the forging process, taking into account factors such as temperature, pressure, and deformation. This helps manufacturers optimize the process parameters, reduce material waste, and improve the quality of the forged parts. The software can also provide visualizations and analysis of the forging process, allowing engineers to identify potential issues and make necessary adjustments.
