A forklift broom is a cleaning device utilized in environments such as warehouses and factories. Typically attached to the forks of a forklift, it operates using the power of the forklift. The front of the device incorporates rotating brushes and vacuum functionality to gather debris and dust from the floor. The operational principle involves the forklift moving, activating the sweeper to clean the floor. Rotating brushes collect the debris, and the vacuum function draws it in. The cleaned debris is collected in the forklift's attachment, ready for later disposal. Key features include efficient integration with the forklift for cleaning, improved operational efficiency, and enhanced cleanliness of the floor surface. This enables quick and easy cleaning tasks in environments like warehouses and manufacturing facilities, contributing to increased overall efficiency.
