According to our (Global Info Research) latest study, the global Formate Dehydrogenase market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

Formate dehydrogenase is an enzyme that catalyzes the oxidation of formate. Formic acid is an organic compound with the chemical formula HCOOH . Formate dehydrogenase works by removing the hydrogen atoms of formic acid, oxidizing it to carbon dioxide (CO_2) and the reduced coenzyme NADH or NADPH. The electrons released during this process can be used in energy production or other metabolic pathways within the cell.

Formate dehydrogenase is found in many organisms, including bacteria, eukaryotes, and some archaea. It is frequently involved in the formate metabolic pathway and energy production during anaerobic respiration in bacteria. In eukaryotes, Formate dehydrogenase may be involved in some important metabolic pathways, such as decarboxylation, formic acid metabolism and denitrification processes.

This enzyme also has a wide range of applications in research. For example, in industry, Formate dehydrogenase could be used to produce organic compounds or biocatalysts for energy conversion. Additionally, it is used as a research tool in areas such as biosensors and biofuel cells.
